

File I

Implementation

1 l3backend-basics implementation

```
1 <*package>
```

Whilst there is a reasonable amount of code overlap between backends, it is much clearer to have the blocks more-or-less separated than run in together and DocStripped out in parts. As such, most of the following is set up on a per-backend basis, though there is some common code (again given in blocks not interspersed with other material).

All the file identifiers are up-front so that they come out in the right place in the files.

```
2 \ProvidesExplFile
3 <*dvipdfmx>
4   {l3backend-dvipdfmx.def}{2025-03-14}{}
5   {L3 backend support: dvipdfmx}
6 </dvipdfmx>
7 <*dvips>
8   {l3backend-dvips.def}{2025-03-14}{}
9   {L3 backend support: dvips}
10 </dvips>
11 <*dvisvgm>
12   {l3backend-dvisvgm.def}{2025-03-14}{}
13   {L3 backend support: dvisvgm}
14 </dvisvgm>
15 <*luatex>
16   {l3backend-luatex.def}{2025-03-14}{}
17   {L3 backend support: PDF output (LuaTeX)}
18 </luatex>
19 <*pdftex>
20   {l3backend-pdftex.def}{2025-03-14}{}
21   {L3 backend support: PDF output (pdfTeX)}
22 </pdftex>
23 <*xetex>
24   {l3backend-xetex.def}{2025-03-14}{}
25   {L3 backend support: XeTeX}
26 </xetex>
```

Check if the loaded kernel is at least enough to load this file. The kernel date has to be at least equal to `\ExplBackendFileDate` or later. If `__kernel_dependency_version_check:Nn` doesn't exist we're loading in an older kernel, so it's an error anyway. With time, this test should vanish and only the dependency check should remain.

```
27 \cs_if_exist:NTF \__kernel_dependency_version_check:nn
28   {
29     \__kernel_dependency_version_check:nn {2023-10-10}
30 <dvipdfmx>   {l3backend-dvipdfmx.def}
31 <dvips>      {l3backend-dvips.def}
32 <dvisvgm>    {l3backend-dvisvgm.def}
33 <luatex>     {l3backend-luatex.def}
34 <pdftex>    {l3backend-pdftex.def}
35 <xetex>     {l3backend-xetex.def}
```

```

36 }
37 {
38   \cs_if_exist_use:cF { @latex@error } { \errmessage }
39   {
40     Mismatched-LaTeX-support-files-detected. \MessageBreak
41     Loading~aborted!
42   }
43   { \use:c { @ehd } }
44   \tex_endinput:D
45 }

```

The order of the backend code here is such that we get somewhat logical outcomes in terms of code sharing whilst keeping things readable. (Trying to mix all of the code by concept is almost unmanageable.) The key parts which are shared are

- Color support is either dvips-like or LuaTeX/pdfTeX-like.
- LuaTeX/pdfTeX and dvipdfmx/X_YTeX share drawing routines.
- X_YTeX is the same as dvipdfmx other than image size extraction so takes most of the same code.

`__kernel_backend_literal:e` The one shared function for all backends is access to the basic `\special` primitive: it has slightly odd expansion behaviour so a wrapper is provided.

```

46 \cs_new_eq:NN __kernel_backend_literal:e \tex_special:D
47 \cs_new_protected:Npn __kernel_backend_literal:n #1
48   { __kernel_backend_literal:e { \exp_not:n {#1} } }

```

(End of definition for `__kernel_backend_literal:e`.)

`__kernel_backend_first_shipout:n` We need to write at first shipout in a few places. As we want to use the most up-to-date method,

```

49 \cs_if_exist:NTF @ifl@t@r
50   {
51     \ifl@t@r \fmtversion { 2020-10-01 }
52     {
53       \cs_new_protected:Npn __kernel_backend_first_shipout:n #1
54         { \hook_gput_code:n { shipout / firstpage } { l3backend } {#1} }
55     }
56     { \cs_new_eq:NN __kernel_backend_first_shipout:n \AtBeginDvi }
57   }
58   { \cs_new_eq:NN __kernel_backend_first_shipout:n \use:n }

```

(End of definition for `__kernel_backend_first_shipout:n`.)

1.1 dvips backend

```

59 <*dvips>

```

`__kernel_backend_literal_postscript:n` Literal PostScript can be included using a few low-level formats. Here, we use the form with no positioning: this is overall more convenient as a wrapper. Note that this does require that where position is important, an appropriate wrapper is included.

```

60 \cs_new_protected:Npn __kernel_backend_literal_postscript:n #1
61   { __kernel_backend_literal:n { ps:: #1 } }
62 \cs_generate_variant:Nn __kernel_backend_literal_postscript:n { e }

```

(End of definition for `_kernel_backend_literal_postscript:n`.)

`_kernel_backend_postscript:n` PostScript data that does have positioning, and also applying a shift to SDict (which is not done automatically by `ps:` or `ps::`, in contrast to `!` or `"`).

```
63 \cs_new_protected:Npn \_kernel_backend_postscript:n #1
64   { \_kernel_backend_literal:n { ps: SDict ~ begin ~ #1 ~ end } }
65 \cs_generate_variant:Nn \_kernel_backend_postscript:n { e }
```

(End of definition for `_kernel_backend_postscript:n`.)

PostScript for the header: a small saving but makes the code clearer. This is held until the start of shipout such that a document with no actual output does not write anything.

```
66 \bool_if:NT \g__kernel_backend_header_bool
67   {
68     \_kernel_backend_first_shipout:n
69     { \_kernel_backend_literal:n { header = l3backend-dvips.pro } }
70   }
```

`_kernel_backend_align_begin:` In `dvips` there is no built-in saving of the current position, and so some additional PostScript is required to set up the transformation matrix and also to restore it afterwards. Notice the use of the stack to save the current position “up front” and to move back to it at the end of the process. Notice that the `[begin]/[end]` pair here mean that we can use a run of PostScript statements in separate lines: not *required* but does make the code and output more clear.

```
71 \cs_new_protected:Npn \_kernel_backend_align_begin:
72   {
73     \_kernel_backend_literal:n { ps::[begin] }
74     \_kernel_backend_literal_postscript:n { currentpoint }
75     \_kernel_backend_literal_postscript:n { currentpoint~translate }
76   }
77 \cs_new_protected:Npn \_kernel_backend_align_end:
78   {
79     \_kernel_backend_literal_postscript:n { neg-exch~neg-exch~translate }
80     \_kernel_backend_literal:n { ps::[end] }
81   }
```

(End of definition for `_kernel_backend_align_begin:` and `_kernel_backend_align_end:.`)

`_kernel_backend_scope_begin:` Saving/restoring scope for general operations needs to be done with `dvips` positioning (try without to see this!). Thus we need the `ps:` version of the special here. As only the graphics state is ever altered within this pairing, we use the lower-cost `g`-versions.

```
82 \cs_new_protected:Npn \_kernel_backend_scope_begin:
83   { \_kernel_backend_literal:n { ps:gsave } }
84 \cs_new_protected:Npn \_kernel_backend_scope_end:
85   { \_kernel_backend_literal:n { ps:grestore } }
```

(End of definition for `_kernel_backend_scope_begin:` and `_kernel_backend_scope_end:.`)

```
86 </dvips>
```

1.2 LuaTeX and pdfTeX backends

```
87 <*luatex | pdftex>
```

Both LuaTeX and pdfTeX write PDFs directly rather than via an intermediate file. Although there are similarities, the move of LuaTeX to have more code in Lua means we create two independent files using shared DocStrip code.

```
\_kernel_backend_literal_pdf:n
\_kernel_backend_literal_pdf:e
```

This is equivalent to `\special{pdf:}` but the engine can track it. Without the `direct` keyword everything is kept in sync: the transformation matrix is set to the current point automatically. Note that this is still inside the text (BT ...ET block).

```
88 \cs_new_protected:Npn \_kernel_backend_literal_pdf:n #1
89 {
90 <*luatex>
91   \tex_pdfextension:D literal
92 </luatex>
93 <*pdftex>
94   \tex_pdfliteral:D
95 </pdftex>
96   { \exp_not:n {#1} }
97 }
98 \cs_new_protected:Npn \_kernel_backend_literal_pdf:e #1
99 {
100 <*luatex>
101   \tex_pdfextension:D literal
102 </luatex>
103 <*pdftex>
104   \tex_pdfliteral:D
105 </pdftex>
106   {#1}
107 }
```

(End of definition for `_kernel_backend_literal_pdf:n`.)

```
\_kernel_backend_literal_page:n
\_kernel_backend_literal_page:e
```

Page literals are pretty simple. To avoid an expansion, we write out by hand.

```
108 \cs_new_protected:Npn \_kernel_backend_literal_page:n #1
109 {
110 <*luatex>
111   \tex_pdfextension:D literal ~
112 </luatex>
113 <*pdftex>
114   \tex_pdfliteral:D
115 </pdftex>
116   page { \exp_not:n {#1} }
117 }
118 \cs_new_protected:Npn \_kernel_backend_literal_page:e #1
119 {
120 <*luatex>
121   \tex_pdfextension:D literal ~
122 </luatex>
123 <*pdftex>
124   \tex_pdfliteral:D
125 </pdftex>
126   page {#1}
127 }
```

(End of definition for `_kernel_backend_literal_page:n`.)

`_kernel_backend_scope_begin:` Higher-level interfaces for saving and restoring the graphic state.

```
\_kernel_backend_scope_end: 128 \cs_new_protected:Npn \_kernel_backend_scope_begin:
                             129   {
                             130   <*luatex>
                             131     \tex_pdfextension:D save \scan_stop:
                             132   </luatex>
                             133   <*pdftex>
                             134     \tex_pdfsave:D
                             135   </pdftex>
                             136   }
                             137 \cs_new_protected:Npn \_kernel_backend_scope_end:
                             138   {
                             139   <*luatex>
                             140     \tex_pdfextension:D restore \scan_stop:
                             141   </luatex>
                             142   <*pdftex>
                             143     \tex_pdfrestore:D
                             144   </pdftex>
                             145   }
```

(End of definition for `_kernel_backend_scope_begin:` and `_kernel_backend_scope_end:.`)

`_kernel_backend_matrix:n` Here the appropriate function is set up to insert an affine matrix into the PDF. With
`_kernel_backend_matrix:e` pdfTeX and LuaTeX in direct PDF output mode there is a primitive for this, which only
needs the rotation/scaling/skew part.

```
146 \cs_new_protected:Npn \_kernel_backend_matrix:n #1
147   {
148   <*luatex>
149     \tex_pdfextension:D setmatrix
150   </luatex>
151   <*pdftex>
152     \tex_pdfsetmatrix:D
153   </pdftex>
154     { \exp_not:n {#1} }
155   }
156 \cs_new_protected:Npn \_kernel_backend_matrix:e #1
157   {
158   <*luatex>
159     \tex_pdfextension:D setmatrix
160   </luatex>
161   <*pdftex>
162     \tex_pdfsetmatrix:D
163   </pdftex>
164     {#1}
165   }
```

(End of definition for `_kernel_backend_matrix:n`.)

```
166 </luatex | pdftex>
```

1.3 dvipdfmx backend

```
167 < *dvipdfmx | xetex >
```

The `dvipdfmx` shares code with the PDF mode one (using the common section to this file) but also with `XqTeX`. The latter is close to identical to `dvipdfmx` and so all of the code here is extracted for both backends, with some `clean up` for `XqTeX` as required. Undocumented but equivalent to pdfTeX’s `literal` keyword. It’s similar to be not the same as the documented `contents` keyword as that adds a `q/Q` pair.

```
\_kernel_backend_literal_pdf:n  
\_kernel_backend_literal_pdf:e
```

```
168 \cs_new_protected:Npn \_kernel_backend_literal_pdf:n #1  
169 { \_kernel_backend_literal:n { pdf:literal~ #1 } }  
170 \cs_generate_variant:Nn \_kernel_backend_literal_pdf:n { e }
```

(End of definition for `_kernel_backend_literal_pdf:n`.)

```
\_kernel_backend_literal_page:n
```

Whilst the manual says this is like `literal direct` in pdfTeX, it closes the BT block!

```
171 \cs_new_protected:Npn \_kernel_backend_literal_page:n #1  
172 { \_kernel_backend_literal:n { pdf:literal~direct~ #1 } }
```

(End of definition for `_kernel_backend_literal_page:n`.)

```
\_kernel_backend_scope_begin:
```

Scoping is done using the backend-specific specials. We use the versions originally from `xdvifpmtx` (`x:`) as these are well-tested “in the wild”.

```
173 \cs_new_protected:Npn \_kernel_backend_scope_begin:  
174 { \_kernel_backend_literal:n { x:gsave } }  
175 \cs_new_protected:Npn \_kernel_backend_scope_end:  
176 { \_kernel_backend_literal:n { x:grestore } }
```

(End of definition for `_kernel_backend_scope_begin:` and `_kernel_backend_scope_end:.`)

```
177 < /dvipdfmx | xetex >
```

1.4 dvisvgm backend

```
178 < *dvisvgm >
```

```
\_kernel_backend_literal_svg:n  
\_kernel_backend_literal_svg:e
```

Unlike the other backends, the requirements for making SVG files mean that we can’t conveniently transform all operations to the current point. That makes life a bit more tricky later as that needs to be accounted for. A new line is added after each call to help to keep the output readable for debugging.

```
179 \cs_new_protected:Npn \_kernel_backend_literal_svg:n #1  
180 { \_kernel_backend_literal:n { dvisvgm:raw~ #1 { ?nl } } }  
181 \cs_generate_variant:Nn \_kernel_backend_literal_svg:n { e }
```

(End of definition for `_kernel_backend_literal_svg:n`.)

```
\g_kernel_backend_scope_int  
\l_kernel_backend_scope_int
```

In SVG, we need to track scope nesting as properties attach to scopes; that requires a pair of `int` registers.

```
182 \int_new:N \g_kernel_backend_scope_int  
183 \int_new:N \l_kernel_backend_scope_int
```

(End of definition for `\g_kernel_backend_scope_int` and `\l_kernel_backend_scope_int`.)

`_kernel_backend_scope_begin:` In SVG, the need to attach concepts to a scope means we need to be sure we will close all
`_kernel_backend_scope_end:` of the open scopes. That is easiest done if we only need an outer “wrapper” `begin/end`
`_kernel_backend_scope_begin:n` pair, and within that we apply operations as a simple scoped statements. To keep down
`_kernel_backend_scope_begin:e` the non-productive groups, we also have a `begin` version that does take an argument.
`_kernel_backend_scope:n`
`_kernel_backend_scope:e`

```

184 \cs_new_protected:Npn \_kernel_backend_scope_begin:
185 {
186   \_kernel_backend_literal_svg:n { <g> }
187   \int_set_eq:NN
188     \l_kernel_backend_scope_int
189     \g_kernel_backend_scope_int
190   \group_begin:
191     \int_gset:Nn \g__kernel_backend_scope_int { 1 }
192 }
193 \cs_new_protected:Npn \_kernel_backend_scope_end:
194 {
195   \prg_replicate:nn
196     { \g_kernel_backend_scope_int }
197     { \_kernel_backend_literal_svg:n { </g> } }
198   \group_end:
199   \int_gset_eq:NN
200     \g__kernel_backend_scope_int
201     \l_kernel_backend_scope_int
202 }
203 \cs_new_protected:Npn \_kernel_backend_scope_begin:n #1
204 {
205   \_kernel_backend_literal_svg:n { <g ~ #1 > }
206   \int_set_eq:NN
207     \l_kernel_backend_scope_int
208     \g__kernel_backend_scope_int
209   \group_begin:
210     \int_gset:Nn \g__kernel_backend_scope_int { 1 }
211 }
212 \cs_generate_variant:Nn \_kernel_backend_scope_begin:n { e }
213 \cs_new_protected:Npn \_kernel_backend_scope:n #1
214 {
215   \_kernel_backend_literal_svg:n { <g ~ #1 > }
216   \int_gincr:N \g__kernel_backend_scope_int
217 }
218 \cs_generate_variant:Nn \_kernel_backend_scope:n { e }

```

(End of definition for `_kernel_backend_scope_begin:` and others.)

```

219 </dvisvgm>
220 </package>

```

2 l3backend-box implementation

```

221 <*package>
222 <@@=box>

```

2.1 dvips backend

```

223 <*dvips>

```

`_box_backend_clip:N` The `dvips` backend scales all absolute dimensions based on the output resolution selected and any `TeX` magnification. Thus for any operation involving absolute lengths there is a correction to make. See `normalscale` from `special.pro` for the variables, noting that here everything is saved on the stack rather than as a separate variable. Once all of that is done, the actual clipping is trivial.

```

224 \cs_new_protected:Npn \_box_backend_clip:N #1
225 {
226   \_kernel_backend_scope_begin:
227   \_kernel_backend_align_begin:
228   \_kernel_backend_literal_postscript:n { matrix~currentmatrix }
229   \_kernel_backend_literal_postscript:n
230   { Resolution~72~div~VResolution~72~div~scale }
231   \_kernel_backend_literal_postscript:n { DVImag~dup~scale }
232   \_kernel_backend_literal_postscript:e
233   {
234     0 ~
235     \dim_to_decimal_in_bp:n { \box_dp:N #1 } ~
236     \dim_to_decimal_in_bp:n { \box_wd:N #1 } ~
237     \dim_to_decimal_in_bp:n { -\box_ht:N #1 - \box_dp:N #1 } ~
238     rectclip
239   }
240   \_kernel_backend_literal_postscript:n { setmatrix }
241   \_kernel_backend_align_end:
242   \hbox_overlap_right:n { \box_use:N #1 }
243   \_kernel_backend_scope_end:
244   \skip_horizontal:n { \box_wd:N #1 }
245 }

```

(End of definition for `_box_backend_clip:N`.)

`_box_backend_rotate:Nn` `_box_backend_rotate_aux:Nn` Rotating using `dvips` does not require that the box dimensions are altered and has a very convenient built-in operation. Zero rotation must be written as 0 not -0 so there is a quick test.

```

246 \cs_new_protected:Npn \_box_backend_rotate:Nn #1#2
247 { \exp_args:Nnf \_box_backend_rotate_aux:Nn #1 { \fp_eval:n {#2} } }
248 \cs_new_protected:Npn \_box_backend_rotate_aux:Nn #1#2
249 {
250   \_kernel_backend_scope_begin:
251   \_kernel_backend_align_begin:
252   \_kernel_backend_literal_postscript:e
253   {
254     \fp_compare:nNnTF {#2} = \c_zero_fp
255     { 0 }
256     { \fp_eval:n { round ( -(#2) , 5 ) } } } ~
257     rotate
258   }
259   \_kernel_backend_align_end:
260   \box_use:N #1
261   \_kernel_backend_scope_end:
262 }

```

(End of definition for `_box_backend_rotate:Nn` and `_box_backend_rotate_aux:Nn`.)

`__box_backend_scale:Nnn` The `dvips` backend once again has a dedicated operation we can use here.

```

263 \cs_new_protected:Npn \__box_backend_scale:Nnn #1#2#3
264 {
265   \__kernel_backend_scope_begin:
266   \__kernel_backend_align_begin:
267   \__kernel_backend_literal_postscript:e
268   {
269     \fp_eval:n { round ( #2 , 5 ) } ~
270     \fp_eval:n { round ( #3 , 5 ) } ~
271     scale
272   }
273   \__kernel_backend_align_end:
274   \hbox_overlap_right:n { \box_use:N #1 }
275   \__kernel_backend_scope_end:
276 }

```

(End of definition for `__box_backend_scale:Nnn`.)

```
277 </dvips>
```

2.2 LuaTeX and pdfTeX backends

```
278 <{*luatex | pdftex}
```

`__box_backend_clip:N` The general method is to save the current location, define a clipping path equivalent to the bounding box, then insert the content at the current position and in a zero width box. The “real” width is then made up using a horizontal skip before tidying up. There are other approaches that can be taken (for example using XForm objects), but the logic here shares as much code as possible and uses the same conversions (and so same rounding errors) in all cases.

```

279 \cs_new_protected:Npn \__box_backend_clip:N #1
280 {
281   \__kernel_backend_scope_begin:
282   \__kernel_backend_literal_pdf:e
283   {
284     0~
285     \dim_to_decimal_in_bp:n { -\box_dp:N #1 } ~
286     \dim_to_decimal_in_bp:n { \box_wd:N #1 } ~
287     \dim_to_decimal_in_bp:n { \box_ht:N #1 + \box_dp:N #1 } ~
288     re~W~n
289   }
290   \hbox_overlap_right:n { \box_use:N #1 }
291   \__kernel_backend_scope_end:
292   \skip_horizontal:n { \box_wd:N #1 }
293 }

```

(End of definition for `__box_backend_clip:N`.)

`__box_backend_rotate:Nn` Rotations are set using an affine transformation matrix which therefore requires sine/cosine values not the angle itself. We store the rounded values to avoid rounding twice. There are also a couple of comparisons to ensure that `-0` is not written to the output, as this avoids any issues with problematic display programs. Note that numbers are compared to 0 after rounding.

```
294 \cs_new_protected:Npn \__box_backend_rotate:Nn #1#2
```

```

295 { \exp_args:Nnf \__box_backend_rotate_aux:Nn #1 { \fp_eval:n {#2} } }
296 \cs_new_protected:Npn \__box_backend_rotate_aux:Nn #1#2
297 {
298   \__kernel_backend_scope_begin:
299   \box_set_wd:Nn #1 { Opt }

328     0~0~
329     \fp_eval:n { round ( #3 , 5 ) }
330   }
331   \hbox_overlap_right:n { \box_use:N #1 }
332   \__kernel_backend_scope_end:
333 }

```

(End of definition for __box_backend_scale:Nnn.)

334 </luatex | pdftex>

2.3 dvipdfmx/X_YTeX backend

335 <*dvipdfmx | xetex>

__box_backend_clip:N The code here is identical to that for Lua_YTeX/pdf_YTeX: unlike rotation and scaling, there is no higher-level support in the backend for clipping.

```

336 \cs_new_protected:Npn \__box_backend_clip:N #1

```

```

337 {
338   \__kernel_backend_scope_begin:
339   \__kernel_backend_literal_pdf:e
340   {
341     0~
342     \dim_to_decimal_in_bp:n { -\box_dp:N #1 } ~
343     \dim_to_decimal_in_bp:n { \box_wd:N #1 } ~
344     \dim_to_decimal_in_bp:n { \box_ht:N #1 + \box_dp:N #1 } ~
345     re~W~n
346   }
347   \hbox_overlap_right:n { \box_use:N #1 }
348   \__kernel_backend_scope_end:
349   \skip_horizontal:n { \box_wd:N #1 }
350 }

```

(End of definition for __box_backend_clip:N.)

__box_backend_rotate:Nn
 __box_backend_rotate_aux:Nn

Rotating in dvipdmtx/X_YTeX can be implemented using either PDF or backend-specific code. The former approach however is not “aware” of the content of boxes: this means that any embedded links would not be adjusted by the rotation. As such, the backend-native approach is preferred: the code therefore is similar (though not identical) to the dvips version (notice the rotation angle here is positive). As for dvips, zero rotation is written as 0 not -0.

```

351 \cs_new_protected:Npn \__box_backend_rotate:Nn #1#2
352 { \exp_args:Nnf \__box_backend_rotate_aux:Nn #1 { \fp_eval:n {#2} } }
353 \cs_new_protected:Npn \__box_backend_rotate_aux:Nn #1#2
354 {
355   \__kernel_backend_scope_begin:
356   \__kernel_backend_literal:e
357   {
358     x:rotate~
359     \fp_compare:nNnTF {#2} = \c_zero_fp
360     { 0 }
361     { \fp_eval:n { round ( #2 , 5 ) } }
362   }
363   \box_use:N #1
364   \__kernel_backend_scope_end:
365 }

```

(End of definition for __box_backend_rotate:Nn and __box_backend_rotate_aux:Nn.)

__box_backend_scale:Nnn

Much the same idea for scaling: use the higher-level backend operation to allow for box content.

```

366 \cs_new_protected:Npn \__box_backend_scale:Nnn #1#2#3
367 {
368   \__kernel_backend_scope_begin:
369   \__kernel_backend_literal:e
370   {
371     x:scale~
372     \fp_eval:n { round ( #2 , 5 ) } ~
373     \fp_eval:n { round ( #3 , 5 ) }
374   }
375   \hbox_overlap_right:n { \box_use:N #1 }
376   \__kernel_backend_scope_end:
377 }

```

(End of definition for `_box_backend_scale:Nnn`.)

```
378 </dviptfm | xetex>
```

2.4 dvisvgm backend

```
379 <*dvisvgm>
```

```
\_box_backend_clip:N  
\g__kernel_clip_path_int
```

Clipping in SVG is more involved than with other backends. The first issue is that the clipping path must be defined separately from where it is used, so we need to track how many paths have applied. The naming here uses `l3cp` as the namespace with a number following. Rather than use a rectangular operation, we define the path manually as this allows it to have a depth: easier than the alternative approach of shifting content up and down using scopes to allow for the depth of the \TeX box and keep the reference point the same!

```
380 \cs_new_protected:Npn \_box_backend_clip:N #1  
381 {  
382   \int_gincr:N \g__kernel_clip_path_int  
383   \_kernel_backend_literal_svg:e  
384   { < clipPath-id = " l3cp \int_use:N \g__kernel_clip_path_int " > }  
385   \_kernel_backend_literal_svg:e  
386   {  
387     <  
388       path ~ d =  
389         "  
390           M ~ 0 ~  
391             \dim_to_decimal:n { -\box_dp:N #1 } ~  
392             L ~ \dim_to_decimal:n { \box_wd:N #1 } ~  
393             \dim_to_decimal:n { -\box_dp:N #1 } ~  
394             L ~ \dim_to_decimal:n { \box_wd:N #1 } ~  
395             \dim_to_decimal:n { \box_ht:N #1 + \box_dp:N #1 } ~  
396             L ~ 0 ~  
397             \dim_to_decimal:n { \box_ht:N #1 + \box_dp:N #1 } ~  
398             Z  
399           "  
400       />  
401     }  
402     \_kernel_backend_literal_svg:n  
403     { < /clipPath > }
```

In general the SVG set up does not try to transform coordinates to the current point. For clipping we need to do that, so have a transformation here to get us to the right place, and a matching one just before the \TeX box is inserted to get things back on track. The clip path needs to come between those two such that if lines up with the current point, as does the \TeX box.

```
404 \_kernel_backend_scope_begin:n  
405 {  
406   transform =  
407     "  
408     translate ( { ?x } , { ?y } ) ~  
409     scale ( 1 , -1 )  
410     "  
411   }  
412 \_kernel_backend_scope:e
```

```

413     {
414         clip-path =
415             "url ( \c_hash_str l3cp \int_use:N \g__kernel_clip_path_int ) "
416     }
417 \__kernel_backend_scope:n
418     {
419         transform =
420             "
421             scale ( -1 , 1 ) ~
422             translate ( { ?x } , { ?y } ) ~
423             scale ( -1 , -1 )
424             "
425     }
426 \box_use:N #1
427 \__kernel_backend_scope_end:
428 }
429 \int_new:N \g__kernel_clip_path_int

```

(End of definition for `__box_backend_clip:N` and `\g__kernel_clip_path_int`.)

`__box_backend_rotate:Nn` Rotation has a dedicated operation which includes a centre-of-rotation optional pair. That can be picked up from the backend syntax, so there is no need to worry about the transformation matrix.

```

430 \cs_new_protected:Npn \__box_backend_rotate:Nn #1#2
431 {
432     \__kernel_backend_scope_begin:e
433     {
434         transform =
435             "
436             rotate
437             ( \fp_eval:n { round ( -(#2) , 5 ) } , ~ { ?x } , ~ { ?y } )
438             "
439     }
440 \box_use:N #1
441 \__kernel_backend_scope_end:
442 }

```

(End of definition for `__box_backend_rotate:Nn`.)

`__box_backend_scale:Nnn` In contrast to rotation, we have to account for the current position in this case. That is done using a couple of translations in addition to the scaling (which is therefore done backward with a flip).

```

443 \cs_new_protected:Npn \__box_backend_scale:Nnn #1#2#3
444 {
445     \__kernel_backend_scope_begin:e
446     {
447         transform =
448             "
449             translate ( { ?x } , { ?y } ) ~
450             scale
451             (
452                 \fp_eval:n { round ( -#2 , 5 ) } ,
453                 \fp_eval:n { round ( -#3 , 5 ) }
454             ) ~

```

```

455         translate ( { ?x } , { ?y } ) ~
456         scale ( -1 )
457     "
458     }
459     \hbox_overlap_right:n { \box_use:N #1 }
460     \__kernel_backend_scope_end:
461 }

```

(End of definition for __box_backend_scale:Nnn.)

```
462 </dvisvgm>
```

```
463 </package>
```

3 I3backend-color implementation

```
464 <*package>
```

```
465 <@@=color>
```

Color support is split into parts: collecting data from L^AT_εX, the color stack, general color, separations, and color for drawings. We have different approaches in each backend, and have some choices to make about dvipdfmx/X_qT_EX in particular. Whilst it is in some ways convenient to use the same approach in multiple backends, the fact that dvipdfmx/X_qT_EX is PDF-based means it (largely) sticks closer to direct PDF output.

3.1 The color stack

For PDF-based engines, we have a color stack available inside the specials. This is used for concepts beyond color itself: it is needed to manage the graphics state generally. Although dvipdfmx/X_qT_EX have multiple color stacks in recent releases, the way these interact with the original single stack and with other graphic state operations means that currently it is not feasible to use the multiple stacks.

3.1.1 Common code

```
466 <*luatex | pdftex>
```

\l__color_backend_stack_int For tracking which stack is in use where multiple stacks are used: currently just pdfT_EX/LuaT_EX but at some future stage may also cover dvipdfmx/X_qT_EX.

```
467 \int_new:N \l__color_backend_stack_int
```

(End of definition for \l__color_backend_stack_int.)

```
468 </luatex | pdftex>
```

3.1.2 LuaT_EX and pdfT_EX

```
469 <*luatex | pdftex>
```

3.2.3 dvipdfmx/X_YTeX

These backends have the most possible approaches: it recognises both dvips-based color specials and its own format, plus one can include PDF statements directly. Recent releases also have a color stack approach similar to pdfTeX. Of the stack methods, the dedicated the most versatile is the latter as it can cover all of the use cases we have. However, at present this interacts problematically with any color on the original stack. We therefore stick to a single-stack approach here.

```
544 <*dvipdfmx | xetex>
```

```

\__color_backend_select:n Using the single stack is relatively easy as there is only one route.
  \_color_backend_select_cmyk:n 545 \cs_new_protected:Npn \__color_backend_select:n #1
  \_color_backend_select_gray:n 546 { \__kernel_backend_literal:n { pdf : bc ~ [ #1 ] } }

Initialising here means creating a small header set up plus massaging some data. This comes about as we have to deal with PDF-focussed data, which makes most sense “higher-up”. The approach is based on ideas from <https://tex.stackexchange.com/q/560093> plus using the PostScript manual for other aspects.

647   { #1 ~ index ~ mul ~ #1 ~ 1 ~ roll ~ }
648   \int_eval:n { #1 + 1 } ~ -1 ~ roll ~ pop
649 }

```

For the generic case, we cannot use /FunctionType 2 unfortunately, so we have to code that idea up in PostScript. Here, we will therefore assume that a range is *always* given. First, we count values in each argument: at the backend level, we can assume there are always well-behaved with spaces present.

```

650 \cs_new:Npn \__color_backend_separation_init:nnn #1#2#3
651 {
652   \exp_args:Ne \__color_backend_separation_init:nnnn
653   { \__color_backend_separation_init_count:n {#2} }
654   {#1} {#2} {#3}
655 }
656 \cs_new:Npn \__color_backend_separation_init_count:n #1
657 { \int_eval:n { 0 \__color_backend_separation_init_count:w #1 ~ \s__color_stop } }
658 \cs_new:Npn \__color_backend_separation_init_count:w #1 ~ #2 \s__color_stop
659 {
660   +1
661   \tl_if_blank:nF {#2}
662   { \__color_backend_separation_init_count:w #2 \s__color_stop }
663 }

```

Now we implement the algorithm. In the terms in the PostScript manual, we have $\mathbf{N} = 1$ and $\mathbf{Domain} = [0\ 1]$, with \mathbf{Range} as #2, $\mathbf{C0}$ as #3 and $\mathbf{C1}$ as #4, with the number of output components in #1. So all we have to do is implement $y_i = \mathbf{C0}_i + x(\mathbf{C1}_i - \mathbf{C0}_i)$

with lots of stack manipulation, then check the ranges. That's done by adding everything to the stack first, then using the fact we know all of the offsets. As manipulating the stack is tricky, we start by re-formatting the **C0** and **C1** arrays to be interleaved, and add a 0 to each pair: this is used to keep the stack of constant length while we are doing the first pass of mathematics. We then working through that list, calculating from the last to the first value before tidying up by removing all of the input values. We do that by first copying all of the final y values to the end of the stack, then rolling everything so we can pop the now-unneeded material.

```

664 \cs_new:Npn \__color_backend_separation_init:nnnn #1#2#3#4
665 {
666   \__color_backend_separation_init:w #3 ~ \s__color_stop #4 ~ \s__color_stop
667   \prg_replicate:nn {#1}
668   {
669     pop ~ 1 ~ index ~ neg ~ 1 ~ index ~ add ~
670     \int_eval:n { 3 * #1 } ~ index ~ mul ~
671     2 ~ index ~ add ~
672     \int_eval:n { 3 * #1 } ~ #1 ~ roll ~
673   }
674   \int_step_function:nnnN {#1} { -1 } { 1 }
675   \__color_backend_separation_init:n
676   \int_eval:n { 4 * #1 + 1 } ~ #1 ~ roll ~
677   \prg_replicate:nn { 3 * #1 + 1 } { pop ~ }
678   \tl_if_blank:nF {#2}
679   { \__color_backend_separation_init:nw {#1} #2 ~ \s__color_stop }
680 }
681 \cs_new:Npn \__color_backend_separation_init:w
682 #1 ~ #2 \s__color_stop #3 ~ #4 \s__color_stop
683 {
684   #1 ~ #3 ~ 0 ~
685   \tl_if_blank:nF {#2}
686   { \__color_backend_separation_init:w #2 \s__color_stop #4 \s__color_stop }
687 }
688 \cs_new:Npn \__color_backend_separation_init:n #1
689 { \int_eval:n { #1 * 2 } ~ index ~ }

```

Finally, we deal with the range limit if required. This is handled by splitting the range into pairs. It's then just a question of doing the comparisons, this time dropping everything except the desired result.

```

```

Initialising the PDF structures needs two parts: creating an object containing the “real” name of the Separation, then adding a reference to that to each page. We use a separate object for the tint transformation following the model in the PDF reference. The object here for the color needs to be named as that way it's accessible to dvipdfmx/X_qTeX.

946 }

```

(End of definition for `__color_backend_iccbased_device:nnn`.)

```

947 </dvipdfmx | luatex | pdftex | xetex>

```

3.4 Fill and stroke color

Here, `dvipdfmx/XYTeX` we write direct PDF specials for the fill, and only use the stack for the stroke color (see above for comments on why we cannot use multiple stacks with these backends). `LuaTeX` and `pdfTeX` have multiple stacks that can deal with fill and stroke. For `dvips` we have to manage fill and stroke color ourselves. We also handle `dvisvgm` independently, as there we can create SVG directly.

```

`_color_backend_fill_cmyk:n` Drawing (fill/stroke) color is handled in dvipdfmx/X_YTeX in the same way as LuaTeX/pdfTeX. We use the same approach as earlier, except the color stack is not involved so the generic direct PDF operation is used. There is no worry about the nature of strokes: everything is handled automatically.

4 I3backend-draw implementation

1165 \langle *package \rangle
1166 \langle @@=draw \rangle

4.1 dvips backend

1167 \langle *dvips \rangle

`_draw_backend_literal:n` The same as literal PostScript: same arguments about positioning apply here.

`_draw_backend_literal:e`

```
1168 \cs_new_eq:NN \_draw_backend_literal:n \_kernel_backend_literal_postscript:n  
1169 \cs_generate_variant:Nn \_draw_backend_literal:n { e }
```

(End of definition for `_draw_backend_literal:n`.)

`_draw_backend_begin:`
`_draw_backend_end:`

The `ps::[begin]` special here deals with positioning but allows us to continue on to a matching `ps::[end]`: contrast with `ps:`, which positions but where we can't split material between separate calls. The `@beginspecial/@endspecial` pair are from `special.pro` and correct the scale and *y*-axis direction. As for `pgf`, we need to save the current point as this is required for box placement. (Note that `@beginspecial/@endspecial` forms a backend scope.)

```
1170 \cs_new_protected:Npn \_draw_backend_begin:  
1171 {  
1172   \_draw_backend_literal:n { [begin] }  
1173   \_draw_backend_literal:n { /draw.x~currentpoint~/draw.y~exch~def~def }  
1174   \_draw_backend_literal:n { @beginspecial }  
1175 }  
1176 \cs_new_protected:Npn \_draw_backend_end:  
1177 {  
1178   \_draw_backend_literal:n { @endspecial }  
1179   \_draw_backend_literal:n { [end] }  
1180 }
```

(End of definition for `_draw_backend_begin:` and `_draw_backend_end:.`)

`_draw_backend_scope_begin:`
`_draw_backend_scope_end:`

Scope here may need to contain saved definitions, so the entire memory rather than just the graphic state has to be sent to the stack.

```
1181 \cs_new_protected:Npn \_draw_backend_scope_begin:  
1182 { \_draw_backend_literal:n { save } }  
1183 \cs_new_protected:Npn \_draw_backend_scope_end:  
1184 { \_draw_backend_literal:n { restore } }
```

(End of definition for `_draw_backend_scope_begin:` and `_draw_backend_scope_end:.`)

`_draw_backend_moveto:nn`
`_draw_backend_lineto:nn`
`_draw_backend_rectangle:nmmn`
`_draw_backend_curveto:nmmmmn`

Path creation operations mainly resolve directly to PostScript primitive steps, with only the need to convert to `bp`. Notice that `e`-type expansion is included here to ensure that any variable values are forced to literals before any possible caching. There is no native rectangular path command (without also clipping, filling or stroking), so that task is done using a small amount of PostScript.

Unlike PDF, PostScript doesn't track separate colors for strokes and other elements. It is also desirable to have the `clip` keyword after a stroke or fill. To achieve those outcomes, there is some work to do. For color, the stroke color is simple but the fill one has to be inserted by hand. For clipping, the required ordering is achieved using a T_EX switch. All of the operations end with a new path instruction as they do not terminate (again in contrast to PDF).

(End of definition for `_draw_backend_dash_pattern:nn` and others.)

```

\_draw_backend_transform:nmmn
\_draw_backend_shift:nn

```

In `dvips`, keeping the transformations in line with the engine is unfortunately not possible for scaling and rotations: even if we decompose the matrix into those operations, there is still no backend tracking (cf. `dvipdfmx/XYTeX`). Thus we take the shortest path available and simply dump the matrix as given.

```

1337 \cs_new_protected:Npn \_draw_backend_transform:nmmn #1#2#3#4
1338 {
1339   \_draw_backend_literal:n
1340   { [ #1 ~ #2 ~ #3 ~ #4 ~ 0 ~ 0 ] ~ concat }

1346 }

```

(End of definition for `_draw_backend_transform:nmmn` and `_draw_backend_shift:nn`.)

```

\_draw_backend_box_use:Nmmmm

```

Inside a picture `@beginspecial/@endspecial` are active, which is normally a good thing but means that the position and scaling would be off if the box was inserted directly. To deal with that, there are a number of possible approaches. A previous implementation suggested by Tom Rokici used `@endspecial/@beginspecial`. This avoids needing internals of `dvips`, but fails if there the box is used inside a scope (see <https://github.com/latex3/latex3/issues/1504>). Instead, we use the same method as `pgf`, which means tracking the position at the PostScript level. Also note that using `@endspecial` would close the scope it creates, meaning that after a box insertion, any local changes would be lost. Keeping `dvips` on track is non-trivial, hence the `[begin]/[end]` pair before the `save` and around the `restore`.

Another split here between LuaTeX/pdfTeX and dvipdfmx/X_YTeX. In the former, we have a direct method to maintain alignment: the backend can use a matrix itself. For dvipdfmx/X_YTeX, we can to decompose the matrix into rotations and a scaling, then use those operations as they are handled by the backend. (There is backend support for matrix operations in dvipdfmx/X_YTeX, but as a matched pair so not suitable for the “stand alone” transformation set up here.) The specials used here are from xdvipdfmx originally: they are well-tested, but probably equivalent to the pdf: versions! As working out the rotation is relatively expensive, we optimise for the case where there is only a scaling.

```

```

Internally, transformations for drawing are tracked as a matrix. Not all engines provide a way of dealing with this: if we use a raw matrix, the engine loses track of positions (for example for hyperlinks), and this is not desirable. They do, however, allow us to track rotations and scalings. Luckily, we can decompose any (two-dimensional) matrix into two rotations and a single scaling:

$$\begin{bmatrix} A & B \\ C & D \end{bmatrix} = \begin{bmatrix} \cos \beta & \sin \beta \\ -\sin \beta & \cos \beta \end{bmatrix} \begin{bmatrix} w_1 & 0 \\ 0 & w_2 \end{bmatrix} \begin{bmatrix} \cos \gamma & \sin \gamma \\ -\sin \gamma & \cos \gamma \end{bmatrix}$$

The parent matrix can be converted to

$$\begin{bmatrix} A & B \\ C & D \end{bmatrix} = \begin{bmatrix} E & H \\ -H & E \end{bmatrix} + \begin{bmatrix} F & G \\ G & -F \end{bmatrix}$$

From these, we can find that

$$\begin{aligned} \frac{w_1 + w_2}{2} &= \sqrt{E^2 + H^2} \\ \frac{w_1 - w_2}{2} &= \sqrt{F^2 + G^2} \\ \gamma - \beta &= \tan^{-1}(G/F) \\ \gamma + \beta &= \tan^{-1}(H/E) \end{aligned}$$

at which point we just have to do various pieces of re-arrangement to get all of the values. (See J. Blinn, *IEEE Comput. Graph. Appl.*, 1996, **16**, 82–88.) There is one wrinkle: the PostScript (and PDF) way of specifying a transformation matrix exchanges where one would normally expect B and C to be.

__draw_backend_box_use:Nnnnn

Inserting a T_EX box transformed to the requested position and using the current matrix is done using a mixture of T_EX and low-level manipulation. The offset can be handled by T_EX, so only any rotation/skew/scaling component needs to be done using the matrix operation. As this operation can never be cached, the scope is set directly not using the draw version.

```

```

(End of definition for `_draw_backend_begin:` and `_draw_backend_end:`.)

`_draw_backend_moveto:nn` Once again, some work is needed to get path constructs correct. Rather than write the values as they are given, the entire path needs to be collected up before being output in one go. For that we use a dedicated storage routine, which adds spaces as required. Since paths should be fully expanded there is no need to worry about the internal `e`-type expansion.

1817   \seq_set_from_clist:Nn
1818   \l__graphics_search_ext_seq
1819   { .pdf , .eps , .ps , .png , .jpg , .jpeg }
1820 }
```

(End of definition for `\l__graphics_search_ext_seq`.)

`\l__graphics_attr_tl`

In PDF mode, additional attributes of an graphic (such as page number) are needed both to obtain the bounding box and when inserting the graphic: this occurs as the graphic dictionary approach means they are read as part of the bounding box operation. As such, it is easier to track additional attributes using a dedicated `tl` rather than build up the same data twice.

```
1821 \tl_new:N \l__graphics_attr_tl
```

(End of definition for `\l__graphics_attr_tl`.)

`__graphics_backend_getbb_jpg:n`

`__graphics_backend_getbb_jpeg:n`

`__graphics_backend_getbb_pdf:n`

`__graphics_backend_getbb_png:n`

`__graphics_backend_getbb_auxi:n`

`__graphics_backend_getbb_auxii:n`

`__graphics_backend_getbb_auxiii:n`

`__graphics_backend_dequote:w`

Getting the bounding box here requires us to box up the graphic and measure it. To deal with the difference in feature support in bitmap and vector graphics but keeping the common parts, there is a little work to do in terms of auxiliaries. The key here is to notice that we need two forms of the attributes: a “short” set to allow us to track for caching, and the full form to pass to the primitive.

```
1822 \cs_new_protected:Npn \__graphics_backend_getbb_jpg:n #1
```

```

```

Measuring the graphic is done by boxing up: for PDF graphics we could use `\tex_pdfximagebbox:D`, but if doesn't work for other types. As the box always starts at (0,0) there is no need to worry about the lower-left position. Quotes need to be *removed* as LuaTeX does not like them here.

```

Inclusion using the specials is relatively straight-forward, but there is one wrinkle. To get the pagebox correct for PDF graphics in all cases, it is necessary to provide both that information and the bbox argument: odd things happen otherwise!

5.4 X_YTeX backend

```
2073 < *xetex >
```

For X_YTeX, there are two primitives that allow us to obtain the bounding box without needing `extractbb`. The only complexity is passing the various minor variations to a common core process. The X_YTeX primitive omits the text box from the page box specification, so there is also some “trimming” to do here.

(End of definition for __graphics_backend_getbb_jpg:n and others.)

__graphics_backend_include_pdf:n For PDF graphics, properly supporting the pagebox concept in X_YTeX is best done using the \tex_XeTeXpdffile:D primitive. The syntax here is the same as for the graphic

measurement part, although we know at this stage that there must be some valid setting for `\l__graphics_pagebox_tl`.

```

2131 \cs_new_protected:Npn \__graphics_backend_include_pdf:n #1
2132 {
2133   \tex_XeTeXpdffile:D #1 ~
2134   \int_compare:nNnT \l__graphics_page_int > 0
2135     { page ~ \int_use:N \l__graphics_page_int \c_space_tl }
2136     \exp_after:wN \__graphics_backend_getbb_pagebox:w \l__graphics_pagebox_tl
2137 }

```

(End of definition for `__graphics_backend_include_pdf:n`.)

`__graphics_backend_get_pagecount:n` Very little to do here other than cover the case of a non-PDF file.

```

2138 \cs_new_protected:Npn \__graphics_backend_get_pagecount:n #1
2139 {
2140   \int_const:cn { c__graphics_#1_pages_int }
2141   {

2146 }

```

(End of definition for `__graphics_backend_get_pagecount:n`.)

```
2147 </xetex>
```

5.5 dvisvgm backend

```
2148 <*dvisvgm>
```

`\l_graphics_search_ext_seq`

```

2149 \__graphics_backend_loaded:n
2150 {
2151   \seq_set_from_clist:Nn
2152   \l_graphics_search_ext_seq
2153   { .svg , .pdf , .eps , .ps , .png , .jpg , .jpeg }
2154 }

```

(End of definition for `\l_graphics_search_ext_seq`.)

`__graphics_backend_getbb_svg:n` This is relatively similar to reading bounding boxes for `.eps` files. Life is though made more tricky as we cannot pick a single line for the data. So we have to loop until we collect up both height and width. To do that, we can use a marker value. We also have to allow for the default units of the lengths: they are big points and may be omitted.

2266     ury = \dim_to_decimal_in_bp:n \l__graphics_ury_dim
2267   }
2268 }

```

(End of definition for __graphics_backend_include_eps:n and others.)

```

\__graphics_backend_include_svg:n
\__graphics_backend_include_png:n
\__graphics_backend_include_jpg:n
\__graphics_backend_include_jpeg:n
\__graphics_backend_include_dequote:w

```

The backend here has built-in support for basic graphic inclusion (see `dvisvgm.def` for a more complex approach, needed if clipping, *etc.*, is covered at the graphic backend level). We have to deal with the fact that the image reference point is at the *top*, so there is a need for a vertical shift to put it in the right place. The other issue is that `#1` must be quote-corrected. The `dvisvgm:img` operation quotes the file name, but if it is already quoted (contains spaces) then we have an issue: we simply strip off any quotes as a result.

```

6 I3backend-pdf implementation

```
2294 (*package)
2295 (@@=pdf)
```

Setting up PDF resources is a complex area with only limited documentation in the engine manuals. The following code builds heavily on existing ideas from hyperref work by Sebastian Rahtz and Heiko Oberdiek, and significant contributions by Alexander Grahn, in addition to the specific code referenced a various points.

6.1 dvips backend

```
2296 (*dvips)
```

```

\__pdf_backend_pdfmark:n Used often enough it should be a separate function.
\__pdf_backend_pdfmark:e
2297 \cs_new_protected:Npn \__pdf_backend_pdfmark:n #1
2298   { \__kernel_backend_postscript:n { mark #1 ~ pdfmark } }
2299 \cs_generate_variant:Nn \__pdf_backend_pdfmark:n { e }
```

(End of definition for __pdf_backend_pdfmark:n.)

6.1.1 Catalogue entries

```

\__pdf_backend_catalog_gput:nn
\__pdf_backend_info_gput:nn
2300 \cs_new_protected:Npn \__pdf_backend_catalog_gput:nn #1#2
2301   { \__pdf_backend_pdfmark:n { { Catalog } << /#1 ~ #2 >> /PUT } }
2302 \cs_new_protected:Npn \__pdf_backend_info_gput:nn #1#2
2303   { \__pdf_backend_pdfmark:n { /#1 ~ #2 /DOCINFO } }
```

6.3.3 Destinations

`_pdf_backend_destination:nn
 _pdf_backend_destination:nmmn
 _pdf_backend_destination_aux:nmmn`

Here, we need to turn the zoom into a scale. The method for `FitR` is from Alexander Grahn: the idea is to avoid needing to do any calculations in \TeX by using the backend data for `@xpos` and `@ypos`. `/FitR` without rule spec doesn't work, so it falls back to `/Fit` here.

```

2760 \cs_new_protected:Npn \_pdf_backend_destination:nn #1#2
2761 {
2762   \_pdf_backend:e
2763   {
2764     dest ~ ( \exp_not:n {#1} )
2765     [
2766       @thispage
2767       \str_case:nnF {#2}
2768       {
2769         { xyz } { /XYZ ~ @xpos ~ @ypos ~ null }
2770         { fit } { /Fit }
2771         { fitb } { /FitB }
2772         { fitbh } { /FitBH }
2773         { fitbv } { /FitBV ~ @xpos }
2774         { fith } { /FitH ~ @ypos }
2775         { fitv } { /FitV ~ @xpos }
2776         { fitr } { /Fit }
2777       }

6.5 PDF Page size (media box)

For setting the media box, the split between backends is somewhat different to other areas, thus we approach this separately. The code here assumes a recent L^AT_EX 2_ε: that is ensured at the level above.

```
2867 <*dvipdfmx | dvips>
```

```

\__pdf_backend_pagesize_gset:nn This is done as a backend literal, so we deal with it using the shipout hook.
2868 \cs_new_protected:Npn \__pdf_backend_pagesize_gset:nn #1#2
2869 {
2870   \__kernel_backend_first_shipout:n

7 l3backend-pdfannot implementation

```
2897 < *package >
2898 < @@=pdfannot >
```

7.1 dvips backend

```
2899 < *dvips >
```

In `dvips`, annotations have to be constructed manually. As such, we need the object code above for some definitions. Here, the PostScript uses the `pdf` namespace: unlike for `expl3`, we do not really control the namespacing and also have to cut across PDF-related areas.

`\l_pdfannot_backend_content_box` The content of an annotation.

```
2900 \box_new:N \l_pdfannot_backend_content_box
```

(End of definition for `\l_pdfannot_backend_content_box`.)

`\l_pdfannot_backend_model_box` For creating model sizing for links.

```
2901 \box_new:N \l_pdfannot_backend_model_box
```

(End of definition for `\l_pdfannot_backend_model_box`.)

`\g_pdfannot_backend_int` Needed to track annotations.

```
2902 \int_new:N \g_pdfannot_backend_int
```

(End of definition for `\g_pdfannot_backend_int`.)

`_pdfannot_backend_generic:nmmn`
`_pdfannot_backend_generic_aux:nmmn`

Annotations are objects but they are not in the object data lists. Here, to get the coordinates of the annotation, we need to have the data collected at the PostScript level. That requires a bit of box trickery (effectively a L^AT_EX 2_ε picture of zero size). Once the data is collected, use it to set up the annotation border.

```
2903 \cs_new_protected:Npn \_pdfannot_backend_generic:nmmn #1#2#3#4

(End of definition for `_pdfannot_backend_generic:nmmn` and `_pdfannot_backend_generic_aux:nmmn`.)

`_pdfannot_backend_last:`

Provide the last annotation we created: could get tricky of course if other packages are loaded.

```
2932 \cs_new:Npn \_pdfannot_backend_last:
2933 { { pdf.annot \int_use:N \g__pdfannot_backend_int } }
```

(End of definition for `_pdfannot_backend_last:`.)

`\g__pdfannot_backend_link_int`

To track annotations which are links.

```
2934 \int_new:N \g__pdfannot_backend_link_int
```

(End of definition for `\g__pdfannot_backend_link_int`.)

`\g__pdfannot_backend_link_dict_tl`

To pass information to the end-of-link function.

```
2935 \tl_new:N \g__pdfannot_backend_link_dict_tl
```

(End of definition for `\g__pdfannot_backend_link_dict_tl`.)

`\g__pdfannot_backend_link_sf_int`

Needed to save/restore space factor, which is needed to deal with the face we need a box.

```
2936 \int_new:N \g__pdfannot_backend_link_sf_int
```

(End of definition for `\g__pdfannot_backend_link_sf_int`.)

`\g__pdfannot_backend_link_math_bool` Needed to save/restore math mode.
2937 `\bool_new:N \g__pdfannot_backend_link_math_bool`
(End of definition for `\g__pdfannot_backend_link_math_bool`.)

`\g__pdfannot_backend_link_bool` Track link formation: we cannot nest at all.
2938 `\bool_new:N \g__pdfannot_backend_link_bool`
(End of definition for `\g__pdfannot_backend_link_bool`.)

`\l__pdfannot_backend_breaklink_pdfmark_tl` Swappable content for link breaking.
2939 `\tl_new:N \l__pdfannot_backend_breaklink_pdfmark_tl`
2940 `\tl_set:Nn \l__pdfannot_backend_breaklink_pdfmark_tl { pdfmark }`
(End of definition for `\l__pdfannot_backend_breaklink_pdfmark_tl`.)

`__pdfannot_backend_breaklink_postscript:n` To allow dropping material unless link breaking is active.
2941 `\cs_new_protected:Npn __pdfannot_backend_breaklink_postscript:n #1 { }`
(End of definition for `__pdfannot_backend_breaklink_postscript:n`.)

`__pdfannot_backend_breaklink_usebox:N` Swappable box unpacking or use.
2942 `\cs_new_eq:MN __pdfannot_backend_breaklink_usebox:N \box_use:N`
(End of definition for `__pdfannot_backend_breaklink_usebox:N`.)

`__pdfannot_backend_link_begin_goto:nw` Links are created like annotations but with dedicated code to allow for adjusting the size
`__pdfannot_backend_link_begin_user:nw` of the rectangle. In contrast to `hyperref`, we grab the link content as a box which can
`__pdfannot_backend_link:nw` then unbox: this allows the same interface as for `pdfTeX`.
`__pdfannot_backend_link_aux:nw` Notice that the link setup here uses `/Action` not `/A`. That is because Distiller *requires*
`__pdfannot_backend_link_end:nw` this trigger word, rather than a “raw” PDF dictionary key (Ghostscript can handle either
`__pdfannot_backend_link_end_aux:nw` form).
`__pdfannot_backend_link_minima:nw` Taking the idea of `evenboxes` from `hypdvips`, we implement a minimum box height
`__pdfannot_backend_link_outerbox:nw` and depth for link placement. This means that “underlining” with a hyperlink will
`__pdfannot_backend_link_sf_save:nw` generally give an even appearance. However, to ensure that the full content is always
`__pdfannot_backend_link_sf_restore:nw` above the link border, we do not allow this to be negative (contrast `hypdvips` approach).
The result should be similar to `pdfTeX` in the vast majority of foreseeable cases.

The object number for a link is saved separately from the rest of the dictionary as this allows us to insert it just once, at either an unbroken link or only in the first line of a broken one. That makes the code clearer but also avoids a low-level PostScript error with the code as taken from `hypdvips`.

Getting the outer dimensions of the text area may be better using a two-pass approach and `\tex_savepos:D`. That plus generic mode are still to re-examine.

```
2943 \cs_new_protected:Npn \__pdfannot_backend_link_begin_goto:nw #1#2
2944 {
2945   \__pdfannot_backend_link_begin:nw
2946   { #1 /Subtype /Link /Action << /S /GoTo /D ( #2 ) >> }
2947 }
2948 \cs_new_protected:Npn \__pdfannot_backend_link_begin_user:nw #1#2
2949 { \__pdfannot_backend_link_begin:nw {#1#2} }
2950 \cs_new_protected:Npn \__pdfannot_backend_link_begin:nw #1
2951 {
```

```

2952     \bool_if:NF \g__pdfannot_backend_link_bool
2953     { \__pdfannot_backend_link_begin_aux:nw {#1} }
2954 }

```

The definition of `pdf.link.dict` here is needed as there is code in the PostScript headers for breaking links, and that can only work with this available.

8 l3backend-opacity implementation

```
3279 <*package>
3280 <@@=opacity>
```

Although opacity is not color, it needs to be managed in a somewhat similar way: using a dedicated stack if possible. Depending on the backend, that may not be possible. There is also the need to cover fill/stroke setting as well as more general running opacity. It is easiest to describe the value used in terms of opacity, although commonly this is referred to as transparency.

```
3281 <*dvips>
```

No stack so set values directly. The need to deal with Distiller and Ghostscript separately means we use a common auxiliary: the two systems require different PostScript for transparency. This is of course not quite as efficient as doing one test for setting all transparency, but it keeps things clearer here. Thanks to Alex Grahn for the detail on testing for GhostScript.

```

3389     \__kernel_backend_literal_pdf:n
3390 </dviptfm | xetex>
3391 <*luatex | pdftex>
3392     \__kernel_color_backend_stack_push:nn \c__opacity_backend_stack_int
3393 </luatex | pdftex>
3394     { /opacity.fill #1 ~ gs /opacity.stroke #2 ~ gs }
3395     \group_insert_after:N \__opacity_backend_reset:
3396   }
3397 }

```

(End of definition for __opacity_backend_fill:n, __opacity_backend_stroke:n, and __opacity_backend_fill_stroke:nn.)

__opacity_backend_select:n Redefine them to stubs if pdfmanagement is either not loaded or deactivated.

```

\__opacity_backend_fill_stroke:nn
3398 \bool_lazy_and:nnF
3399 { \cs_if_exist_p:N \pdfmanagement_if_active_p: }
3400 { \pdfmanagement_if_active_p: }
3401 {
3402   \cs_gset_protected:Npn \__opacity_backend_select:n #1 { }
3403   \cs_gset_protected:Npn \__opacity_backend_fill_stroke:nn #1#2 { }
3404 }

```

(End of definition for __opacity_backend_select:n and __opacity_backend_fill_stroke:nn.)

```

3405 </dviptfm | luatex | pdftex | xetex>

```

```

3406 <*dvisvgm>

```

__opacity_backend_select:n Once again, we use a scope here. There is a general opacity function for SVG, but that is of course not set up using the stack.

```

\__opacity_backend_fill:n
\__opacity_backend_stroke:n
\__opacity_backend:nn
3407 \cs_new_protected:Npn \__opacity_backend_select:n #1
3408   { \__opacity_backend:nn {#1} { } }
3409 \cs_new_protected:Npn \__opacity_backend_fill:n #1
3410   { \__opacity_backend:nn {#1} { fill- } }
3411 \cs_new_protected:Npn \__opacity_backend_stroke:n #1
3412   { \__opacity_backend:nn {#1} { stroke- } }
3413 \cs_new_protected:Npn \__opacity_backend:nn #1#2
3414   { \__kernel_backend_scope:e { #2 opacity = " #1 " } }

```

(End of definition for __opacity_backend_select:n and others.)

```

3415 </dvisvgm>

```

```

3416 </package>

```

8.1 Font handling integration

In Lua_T_E_X we want to use these functions also for transparent fonts to avoid interference between both uses of transparency.

```

3417 <*lua>

```

First we need to check if pdfmanagement is active from Lua.

```

3418 local pdfmanagement_active do
3419   local pdfmanagement_if_active_p = token.create'pdfmanagement_if_active_p:'
3420   local cmd = pdfmanagement_if_active_p.cmdname
3421   if cmd == 'undefined_cs' then

```

```

3422     pdfmanagement_active = false
3423 else
3424     token.put_next(pdfmanagement_if_active_p)
3425     pdfmanagement_active = token.scan_int() ~= 0
3426 end
3427 end
3428
3429 if pdfmanagement_active and luaotfload and luaotfload.set_transparent_colorstack then
3430     luaotfload.set_transparent_colorstack(function() return token.create'c_opacity_backend_st
3431
3432     local transparent_register = {
3433         token.create'pdfmanagement_add:nm',
3434         token.new(0, 1),
3435         'Page/Resources/ExtGState',
3436         token.new(0, 2),
3437         token.new(0, 1),
3438         '',
3439         token.new(0, 2),
3440         token.new(0, 1),
3441         '<</ca ',
3442         '',
3443         '/CA ',
3444         '',
3445         '>>',
3446         token.new(0, 2),
3447     }
3448     luatexbase.add_to_callback('luaotfload.parse_transparent', function(value)
3449         value = (octet * -1):match(value)
3450         if not value then
3451             tex.error'Invalid transparency value'
3452             return
3453         end
3454         value = value:sub(1, -2)
3455         local result = 'opacity' .. value
3456         tex.runtoks(function()
3457             transparent_register[6], transparent_register[10], transparent_register[12] = result,
3458             tex.sprint(-2, transparent_register)
3459         end)
3460         return '/' .. result .. ' gs'
3461     end, 'l3opacity')
3462 end
3463 </lua>

```

9 l3backend-header implementation

```

3464 <*dvips & header>

```

`color.sc` Empty definition for color at the top level.

```

3465 /color.sc { } def

```

(End of definition for color.sc.)

TeXcolorseparation Support for separation/spot colors: this strange naming is so things work with the color
separation stack.

```

3466 TeXDict begin
3467 /TeXcolorseparation { setcolor } def
3468 end

```

(End of definition for TeXcolorseparation and separation.)

pdf.globaldict A small global dictionary for backend use.

```

3469 true setglobal
3470 /pdf.globaldict 4 dict def
3471 false setglobal

```

(End of definition for pdf.globaldict.)

pdf.cvs Small utilities for PostScript manipulations. Conversion to DVI dimensions is done here
pdf.dvi.pt to allow for Resolution. The total height of a rectangle (an array) needs a little maths,
pdf.pt.dvi in contrast to simply extracting a value.

```

pdf.rect.ht 3472 /pdf.cvs { 65534 string cvs } def
3473 /pdf.dvi.pt { 72.27 mul Resolution div } def
3474 /pdf.pt.dvi { 72.27 div Resolution mul } def
3475 /pdf.rect.ht { dup 1 get neg exch 3 get add } def

```

(End of definition for pdf.cvs and others.)

pdf.linkmargin Settings which are defined up-front in SDict.

```

pdf.linkdp.pad 3476 /pdf.linkmargin { 1 pdf.pt.dvi } def
pdf.linkht.pad 3477 /pdf.linkdp.pad { 0 } def
3478 /pdf.linkht.pad { 0 } def

```

(End of definition for pdf.linkmargin, pdf.linkdp.pad, and pdf.linkht.pad.)

pdf.rect Functions for marking the limits of an annotation/link, plus drawing the border. We
pdf.save.ll separate links for generic annotations to support adding a margin and setting a minimal
pdf.save.ur size.

```

pdf.rect 3479 /pdf.rect
pdf.save.ll 3480 { /Rect [ pdf.llx pdf.lly pdf.urx pdf.ury ] } def
pdf.save.linkur 3481 /pdf.save.ll

pdf.urx 3484 /pdf.lly exch def
pdf.ury 3485 /pdf.llx exch def
3486 }
3487 def
3488 /pdf.save.ur
3489 {
3490 currentpoint
3491 /pdf.ury exch def
3492 /pdf.urx exch def
3493 }
3494 def
3495 /pdf.save.linkll
3496 {
3497 currentpoint
3498 pdf.linkmargin add
3499 pdf.linkdp.pad add
3500 /pdf.lly exch def

```

```

3501     pdf.linkmargin sub
3502     /pdf.llx exch def
3503   }
3504   def
3505 /pdf.save.linkur
3506 {
3507   currentpoint
3508   pdf.linkmargin sub
3509   pdf.linkht.pad sub
3510   /pdf.ury exch def
3511   pdf.linkmargin add
3512   /pdf.urx exch def
3513 }
3514 def

```

(End of definition for pdf.rect and others.)

pdf.dest.anchor For finding the anchor point of a destination link. We make the use case a separate
pdf.dest.x function as it comes up a lot, and as this makes it easier to adjust if we need additional
pdf.dest.y effects. We also need a more complex approach to convert a coordinate pair correctly
pdf.dest.point when defining a rectangle: this can otherwise be out when using a landscape page.
pdf.dest2device (Thanks to Alexander Grahn for the approach here.)

```

pdf.dev.x 3515 /pdf.dest.anchor
pdf.dev.y 3516 {
pdf.tmpa 3517   currentpoint exch
pdf.tmpb 3518   pdf.dvi.pt 72 add

3542   pdf.dest.x pdf.tmpa mul
3543   pdf.dest.y pdf.tmpc mul add
3544   pdf.dev.x add
3545   pdf.dest.x pdf.tmpb mul
3546   pdf.dest.y pdf.tmpd mul add

```

```

3547     pdf.dev.y add
3548   }
3549   def

```

(End of definition for pdf.dest.anchor and others.)

```

pdf.bordertracking To know where a breakable link can go, we need to track the boundary rectangle. That
pdf.bordertracking.begin can be done by hooking into a and x operations: those names have to be retained. The
pdf.bordertracking.end boundary is stored at the end of the operation. Special effort is needed at the start and
pdf.leftboundary end of pages (or rather galleys), such that everything works properly.

pdf.breaklink Dealing with link breaking itself has multiple stage. The first step is to find the **Rect** entry
pdf.breaklink.write in the dictionary, looping over key–value pairs. The first line is handled first, adjusting
pdf.count the rectangle to stay inside the text area. The second phase is a loop over the height of
pdf.currentrect the bulk of the link area, done on the basis of a number of baselines. Finally, the end of
the link area is tidied up, again from the boundary of the text area.

```

(End of definition for pdf.breaklink and others.)

pdf.pdfmark The business end of breaking links starts by hooking into pdfmarks. Unlike hypdvips,
pdf.pdfmark.good we avoid altering any links we have not created by using a copy of the core pdfmarks
pdf.outerbox function. Only mark types which are known are altered. At present, this is purely ANN
pdf.baselineskip marks, which are measured relative to the size of the baseline skip. If they are more than
pdf.pdfmark.dict one apparent line high, breaking is applied.
